Boron concentrations (B/Ca) and isotopic compositions ( $\delta^{11}\text{B}$ ) of biogenic marine carbonates are widely applied to reconstruct past changes in ocean carbonate chemistry. Such applications typically assume that borate ion ( $\text{B}(\text{OH})_4^-$ ) is the principal boron species incorporated into carbonates. However, recent  $\delta^{11}\text{B}$ , B/Ca and B coordination studies in both inorganic and biogenic carbonates suggest more complex B incorporation pathways, potentially involving boric acid ( $\text{B}(\text{OH})_3$ ) and/or intermediate deprotonated B species<sup>1,2</sup>. To provide insight on B incorporation into inorganic carbonates, here we present  $\delta^{11}\text{B}$  measurements on inorganic calcites grown under controlled laboratory conditions for which B/Ca data were previously reported<sup>1</sup>. Our  $\delta^{11}\text{B}$  data highlight three results: First, inorganic calcite  $\delta^{11}\text{B}$  decreases when either solution [DIC] or solution [ $\text{Ca}^{2+}$ ] is increased. Second, the sensitivity of inorganic calcite  $\delta^{11}\text{B}$  to pH decreases with increasing solution [B]. Third, the B isotope fractionation between inorganic calcite and  $\text{B}(\text{OH})_4^-$  decreases systematically with increasing precipitation rate ( $R$ ). These results suggest that kinetic effects govern B incorporation into inorganic calcite, as previously suggested<sup>1</sup>. While published B/Ca studies argued for preferential  $\text{B}(\text{OH})_3$  incorporation at higher  $R$ <sup>1</sup>, which should cause higher  $\delta^{11}\text{B}$  at higher  $R$ , our data instead show lower  $\delta^{11}\text{B}$  (relative to  $\text{B}(\text{OH})_4^-$ ) at higher  $R$ . This may imply that either the B species incorporated at higher  $R$  more dominantly reflects  $\text{B}(\text{OH})_4^-$ , or kinetic isotope effects occur that favor incorporation of lighter isotopes at higher  $R$ . We will present insights on these B/Ca and  $\delta^{11}\text{B}$  observations gained from surface reaction kinetic modeling of boron incorporation. Implications of these inorganic calcite experiments for aqueous boron proxies will also be discussed.
